

Herring (*Clupea harengus*) in divisions 6.a and 7.b–c (West of Scotland, West of Ireland)

ICES advice on fishing opportunities

ICES advises that when the precautionary approach is applied, there should be zero catch in 2021.

Note: This advice sheet is abbreviated due to the COVID-19 disruption. The previous advice issued for 2020 is attached as Annex 1.

Stock development over time

The information presented here represents two stocks assessed as one (herring in Division 6.a [N], and herring in divisions 6.a [S] and 7.b–c).

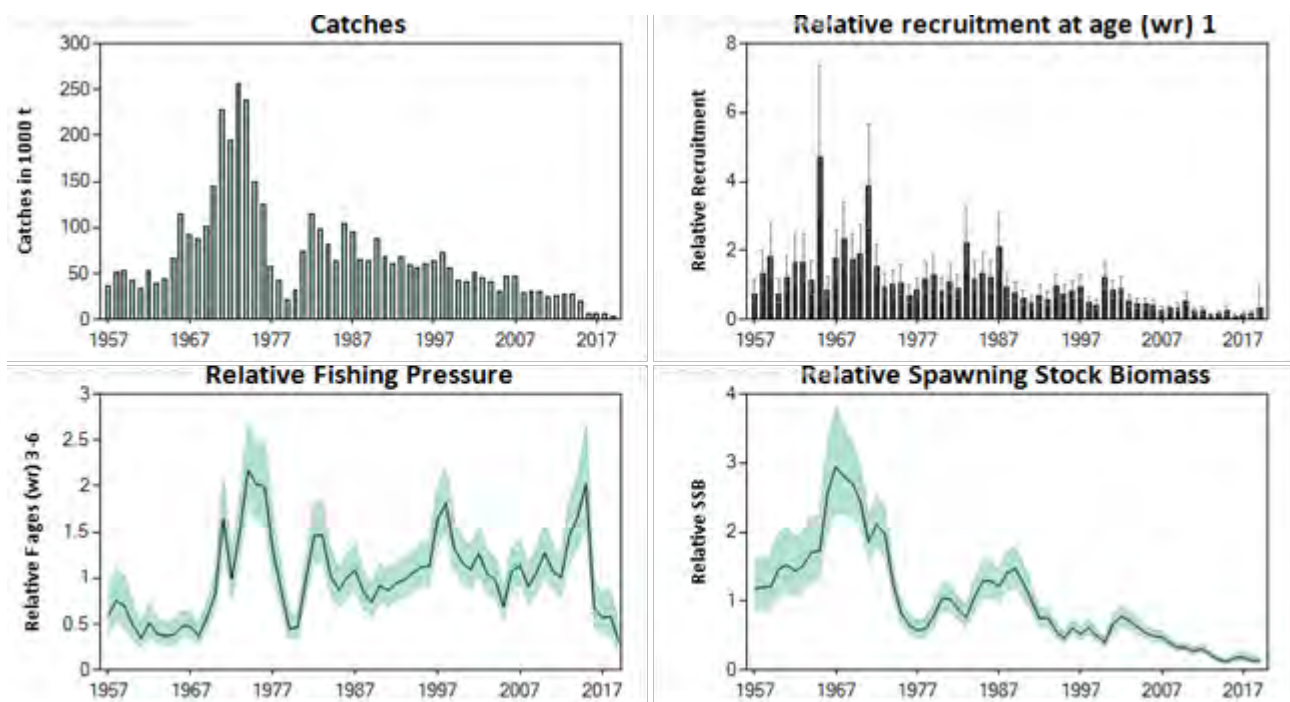

Figure 1 Herring in divisions 6.a and 7.b–c. Summary of the stock assessment. Relative recruitment (R), fishing mortality (F), and spawning-stock biomass (SSB) from the stock assessment (relative to mean over assessment period). Shaded areas on the F and SSB plots represent 95% confidence intervals.

Stock and exploitation status

Table 1 Herring in divisions 6.a and 7.b–c. State of the stock and the fishery relative to reference points.

	Fishing pressure				Stock size					
		2017	2018	2019	2017	2018	2019			
Maximum sustainable yield	F_{MSY}	?	?	?	Undefined	$MSY B_{trigger}$?	?	?	Undefined
Precautionary approach	F_{pa}, F_{lim}	?	?	?	Undefined	B_{pa}, B_{lim}	?	?	?	Undefined
Management plan	F_{MGT}	–	–	–	Not applicable	B_{MGT}	–	–	–	Not applicable
Qualitative evaluation	–	↘	↔	↘	Decreasing	–	⊗	⊗	⊗	Below possible reference points

Catch scenarios

The ICES framework for category 3 stocks was applied (ICES, 2012). Given that SSB is currently assessed to be close to the lowest level in the time-series and is likely to remain so in 2021, and that it is below possible reference points, the advice is for zero catch for 2021.

History of the advice, catch, and management

Table 2 Herring in divisions 6.a and 7.b–c. ICES advice and official landings. All weights are in tonnes.

Year	ICES advice	Catch corresponding to advice	Agreed TAC in Div. 5.b., 6.b, and 6.a (N)	Agreed TAC in Div. 6.a (S), 7.b–c	Discards	ICES estimated catches
2015 *	Prior to the advice for 2016, ICES provided advice separately for herring in Division 6.a North and herring in Division 6.a South and 7.b–c. See ICES (2014a, 2014b) for the history of ICES advice on these individual stocks.	-	22690		0	19885
2016	MSY approach	0	4170	1630	0	6937 ^
2017	MSY approach	0	4170	1630	0	6428
2018	MSY approach	0	4170	1630	0	5558
2019	MSY approach	0	4170	1630	0	3429
2020	Precautionary approach	0	3480	1360		
2021	Precautionary approach	0				

* See Table 5.3.12.1 in ICES (2014a) and Table 5.3.13.1 in ICES (2014b) for the full histories of ICES advice, management, landings, and catches.

^ Including catches from the carried-over 2015 TAC.

Summary of the assessment

Table 3 Herring in divisions 6.a and 7.b–c. Assessment summary. Weights are in tonnes. Age is in winter rings (wr). Highs and lows refer to 95% confidence intervals. All values are relative to the time-series average, except catch.

Year	Relative recruitment at age (wr) 1	High	Low	Relative SSB	High	Low	Catches (tonnes)	Relative F at ages (wr) 3–6	High	Low

Annex 1

Herring (*Clupea harengus*) in divisions 6.a and 7.b–c (West of Scotland, West of Ireland)

ICES advice on fishing opportunities

ICES advises that when the precautionary approach is applied, there should be zero catch in 2020.

Stock development over time

The information presented here represents two stocks (herring in Division 6.a(N), and herring in divisions 6.a(S) and 7.b–c) assessed as one.

Both spawning-stock biomass (SSB) and Recruitment (R) have been declining since around 2000 and are at their lowest level in the time series. Fishing mortality (F) has reduced since 2016 when catches have been limited to a monitoring TAC.

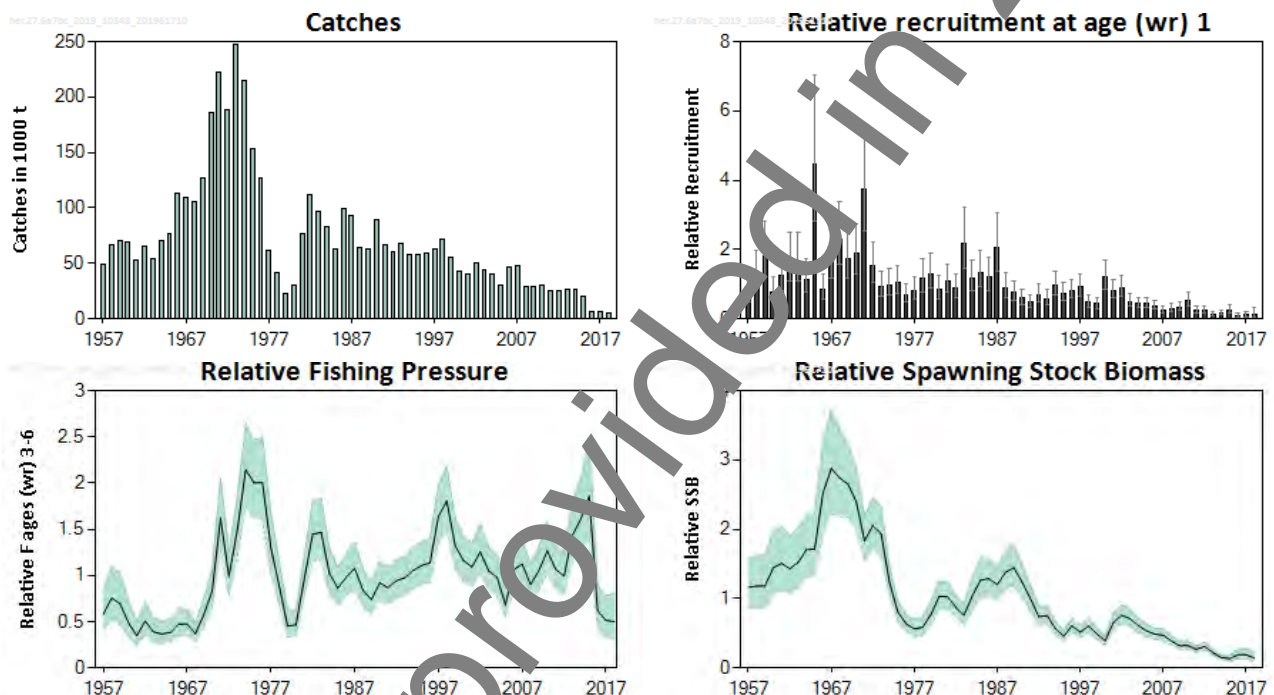

Figure 1 Herring in divisions 6.a and 7.b–c. Summary of the stock assessment. Relative R, F, and SSB from the stock assessment (relative to mean over assessment period). The shaded areas on the F and SSB plots represent 95% confidence intervals.

Stock and exploitation status

ICES cannot assess the stock and exploitation status relative to MSY and PA reference points, because those reference points are undefined.

Table 1 Herring in divisions 6.a and 7.b–c. State of the stock and fishery relative to reference points.

		Fishing pressure			Stock size					
		2016	2017	2018	2016	2017	2018			
Maximum sustainable yield	F_{MSY}	?	?	?	Undefined	$MSY B_{trigger}$?	?	?	Undefined
Precautionary approach	F_{pa}, F_{lim}	?	?	?	Undefined	B_{pa}, B_{lim}	?	?	?	Undefined
Management plan	F_{MGT}	–	–	–	Not applicable	B_{MGT}	–	–	–	Not applicable
Qualitative evaluation	–	↘	↘	→	Stable	–	⊗	⊗	⊗	Below possible reference points

Catch scenarios

The ICES framework for category 3 stocks was applied (ICES, 2012). Given that SSB is currently assessed to be close to the lowest level in the time series and is likely to remain so in 2020, and that it is below possible reference points, the advice is for zero catch for 2020.

Basis of the advice

Table 2 Herring in divisions 6.a and 7.b–c. The basis of the advice.

Advice basis	Precautionary approach
Management plan	ICES is not aware of an agreed precautionary management plan for herring in this area. A proposed rebuilding plan has not been evaluated by ICES.

Quality of the assessment

An interbenchmark was carried out on this stock in 2019 due to the strong retrospective bias in the 2018 assessment (ICES, 2019a). The IBTS survey estimates were revised, the acoustic surveys combined into a single index, and catch data were reconfigured to account for fleet-specific differences. The updated assessment model still, however, has a strong retrospective bias.

The interbenchmark points to continued concerns with the quality of the combined assessment, and how well it is able to represent the dynamics of the separate stocks and fisheries in 6.a(N) and 6.a(S) and 7.b–c. The assessment still suffers from a lack of information on younger-aged fish. Given unresolved issues with the assessment it is used as indicative of trends only.

The updated assessment shows a different trajectory of the stock, with SSB and recruitment revised downwards and at very low levels. However, the perception of the current state of the stock is unchanged compared to previous assessments. The fishing mortality has been revised upward, with a decrease evident since the introduction of the monitoring TAC.

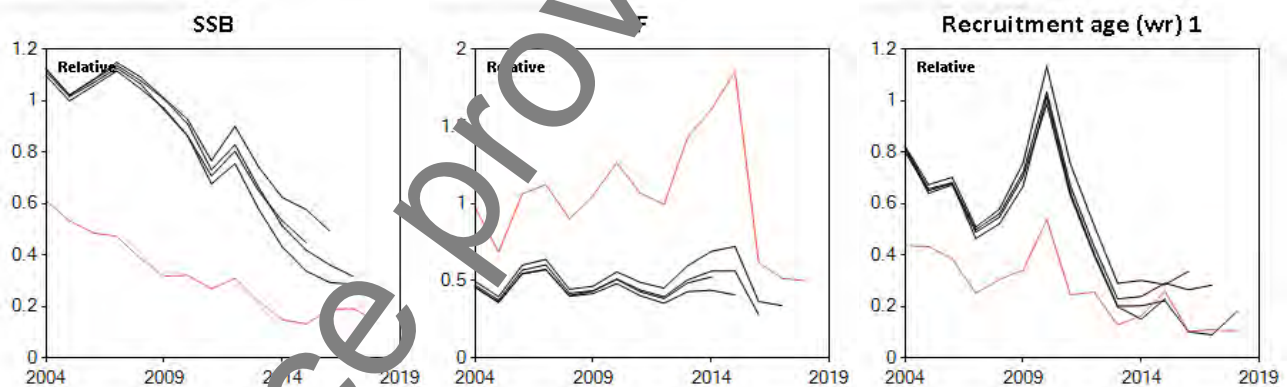

Figure 2 Herring in divisions 6.a and 7.b–c. Historical assessment results. The stock was inter-benchmarked in 2019.

Issues relevant for the advice

In April 2016, ICES issued advice for a scientific monitoring fishery that could be obtained through a catch of 4840 tonnes for herring in this area, at the request of the European Commission (ICES, 2016a). The EC established a monitoring TAC of 5800 tonnes in 2016, which has been maintained since then.

A rebuilding plan, which contains provisions for a monitoring TAC while the combined stocks remain below B_{lim} (based on previous assessments), was evaluated by ICES (ICES, 2017). A key aim of the plan is to provide sampling opportunities; this includes sampling for assessment input catch-at-age information as well as sample collection for stock discrimination

research, whilst ensuring that the stock can be rebuilt. However, the plan was found not to be precautionary. A revised version of the rebuilding plan was submitted to ICES by the European Commission in 2018 but has not been evaluated.

ICES considers it important to develop a stock recovery plan for herring in divisions 6.a and 7.b–c, but the continued uncertainty in the quality of the assessment and stock mixing need to be resolved in order to enable the evaluation of a rebuilding plan.

Activities that have a negative impact on the spawning habitat of herring should not occur, unless the effects of these activities have been assessed and shown not to be detrimental to these combined stocks (ICES, 2003, 2015b).

There has been an increase in marine anthropogenic activity, especially in the area of marine renewable energy. Construction and development of, for example, wind farms results in disturbance to the seabed. Any activities that have a negative impact on the spawning habitat of herring, such as the extraction of marine aggregates (e.g. gravel and sand) and construction in the vicinity of spawning grounds, require consideration (see for example, Groot, 1979, 1996; ICES 2003, 2015b). This is because a gravel substratum is an essential habitat for herring spawning.

Reference points

No reference points are defined for these combined stocks.

Basis of the assessment

Table 3 Herring in divisions 6.a and 7.b–c. Basis of the assessment and advice.

ICES stock data category	3 (ICES, 2018)
Assessment type	Age-based assessment indicative of trends (FISAM, ICES 2019b).
Input data	Commercial catches, (weights, ages, and length frequencies from catch sampling); combined West of Scotland and Malin Shelf Herring Acoustic Survey data (WoS + MSHAS 1991–2018), Scottish west coast IBTS surveys Q1 (1994–2018) and Q4 (1994–2018).
Discards and bycatch	Not included, considered negligible.
Indicators	None
Other information	Benchmarked in WKWEST (ICES, 2019a), updated with corrected natural mortalities by ICES (2015c). Inter-benchmarked in 2019 (ICES 2019a). These combined stocks are winter / winter spawners. Age is given in winter rings (wr), so for example: a 2-year-old fish is termed “1-winter ring”.
Working group	Herring Assessment Working Group for the Area South of 62°N (HAWG)

Information from stakeholders

The industry, in conjunction with the PelAC, initiated a major genetic research programme in 2016 that aimed to elucidate existing information on stock mixing in divisions 6.a and 7.b-c. Preliminary analyses from the study indicated that the 6.a(N) and 6.a(S) / 7.b–c herring stocks represent two genetically-distinct populations. In 2018 University College Dublin, the Irish Marine Institute and Marine Scotland Science began a three-year project to develop this programme further. This project is now well advanced in terms of this separation analyses.

The industry-initiated acoustic survey which commenced in 2016 was continued in 2017 and 2018, and will take place again in 2019. This will provide a minimum estimate of spawning-stock size, and provide genetic and morphometric samples of the two separate spawning populations.

The PelAC sent a revised draft rebuilding plan for herring in 6.a and 7.b–c in March 2018 to the Commission, which was submitted to ICES for evaluation. ICES has not evaluated this rebuilding plan.

History of the advice, catch, and management

Table 4 Herring in divisions 6.a and 7.b–c. ICES advice and official landings. All weights are in tonnes.

Year	ICES advice	Catch corresponding to advice	Agreed TAC in Div. 5.b., 6.b, and 6.a (N)	Agreed TAC in Div. 6.a (S), 7.bc	Discards	ICES estimated catches
2015 *	Prior to the advice for 2016, ICES advised separately for herring in Division 6.a North and herring in Division 6.a South and 7.b,c. See ICES (2014a and 2014b) for the history of ICES advice on these individual stocks	-	22690	0	0	19885
